

**Title: "Modeling & Simulation of a Production line(Panle line) in Shipbuilding Industry using Tecnomatix Plant Simulation 9.0"**

Author: Yohannes Tekle-Muhabie

Rostock, Germany      February 7, 2012

University of Rostock | Naval Architecture and Marine Engineering

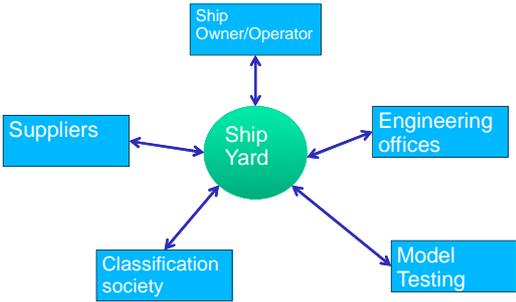

**Presentation Outline**

- ▶ Introduction
- ▶ Objective
- ▶ Research Methodology
- ▶ Flow Chart
- ▶ Data Collection & Synthesis
- ▶ Model Development
- ▶ Scenario Analysis
- ▶ Interface with MS Office
- ▶ Conclusion

University of Rostock | Naval Architecture and Ocean Engineering      2      February 2012

**Introduction/Overview of ship building Industry**

```

    MT[Model Testing] <--> SY
  
```

**Characterized by**

- One of a kind
- Multiple systems
- No percentage completion

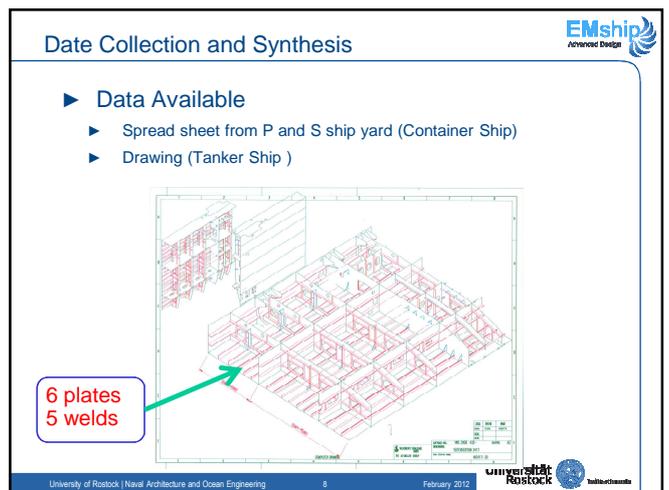

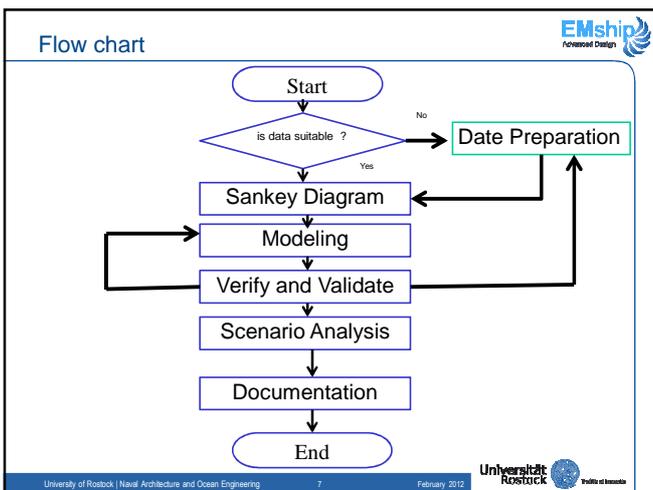

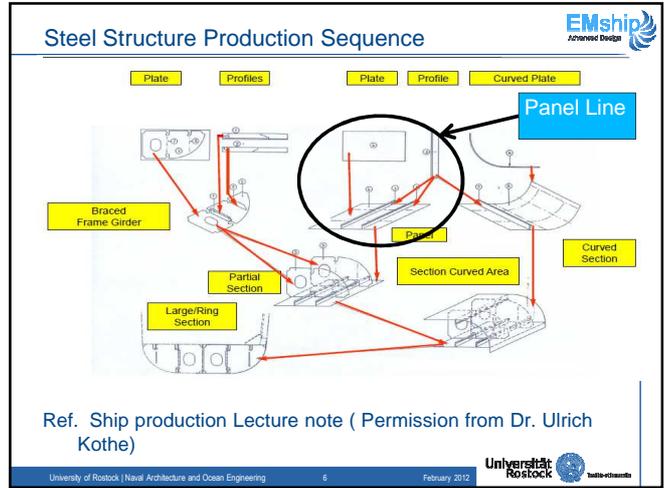

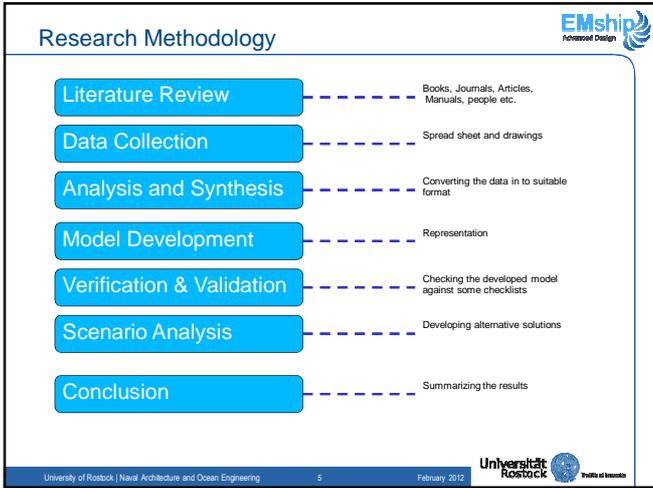

University of Rostock | Naval Architecture and Ocean Engineering      3      February 2012

**Objective of the thesis**

- ▶ General Objective
  - ▶ Analyze and optimize the panel line
- ▶ Specific Objectives
  - ▶ Data identification and synthesis
  - ▶ Model and simulate the panel line
  - ▶ Bottleneck identification
  - ▶ Investigating the effect of new work station

### Profile welding and Completion Combined

| Experiment | Profile welding Minute | Completion Minute | Output Sheets |
|------------|------------------------|-------------------|---------------|
| 16         | 50                     | 65                | 5041          |
| 40         | 51                     | 65                | 5041          |
| 64         | 52                     | 65                | 5041          |
| 88         | 53                     | 65                | 5041          |
| 112        | 54                     | 65                | 5041          |
| 136        | 55                     | 65                | 5041          |
| 160        | 56                     | 65                | 5041          |
| 184        | 57                     | 65                | 5041          |
| 208        | 58                     | 65                | 5041          |

$$= (5041 - 3996) / 3996 * 100\%$$

$$= 26.2\% \text{ improvement}$$

### Adding new work station (PVPs station)

**Purpose: Analyzing the effect of new work station**

Parameters:

- One stiffened panel comprises 2.25 sheets
- Ten points for proper placement of PVPs (0.5 minute each)
- Robot welding
  - Speed,  $V=0.0083 \text{ m/s}$
  - Length,  $L=2.8 \text{ m}$

Single run,  $\text{time} = L/V = 5.62 \text{ minutes}$

Considering 4 runs to entirely weld the PVPs =  $4 * 5.62 = 22.5 \text{ minutes}$

Total time for a single PVPs operation = **28.5 minutes**

### Cycle time (PVPs) Station

PVPs=6

3994 sheets/yr  
No significant effect

PVPs=7

3695 sheets/yr  
Decline by 7.5 %

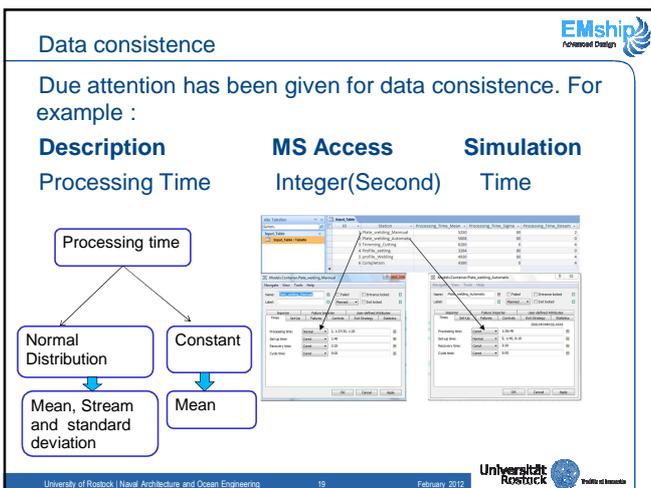

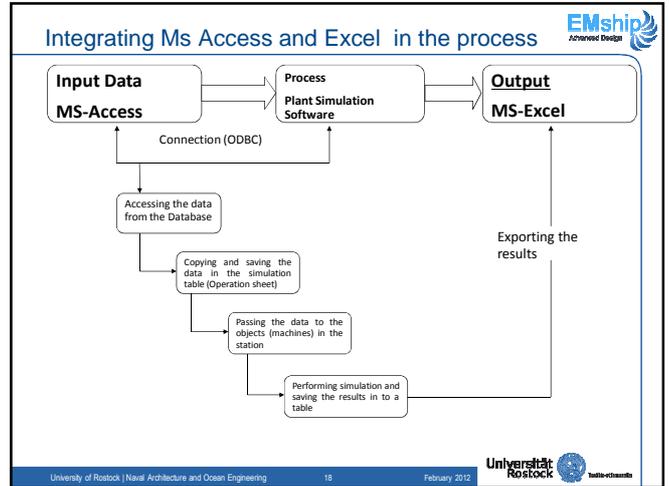

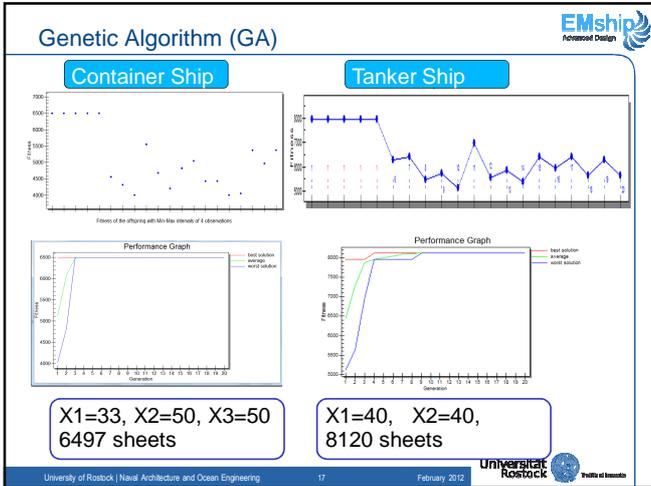

### Genetic Algorithm (GA)

GA helps to find out an optimal solution based on a stochastic approach and it starts with an initial random solution set [20].

Objective: Maximize Production rate

Subject to :

- $30 \leq X1 \leq 54.4$  / Profile setting station/
- $50 \leq X2 \leq 82$  / Profile welding/
- $50 \leq X3 \leq 73$  / Completion/

### Conclusion

- ❖ It facilitates the decision making process
- ❖ Profile welding is the station where due attention has to be given
- ❖ It is suitable for new work station design
- ❖ Max number of PVPs are 6 and 4 for Container & Tanker respectively

Future work :

- ✓ Cost benefit analysis has to be incorporated
