

Numerical Simulation of Brash Ice

Master Thesis Presentation: EMShip Week

13th February 2018 La Spezia

Rupasingha Arachchige Malith Prasanna

Supervisor : Prof. Robert Bronsart, University of Rostock
Quentin Hisette, The Hamburg Ship Model Basin

Objectives

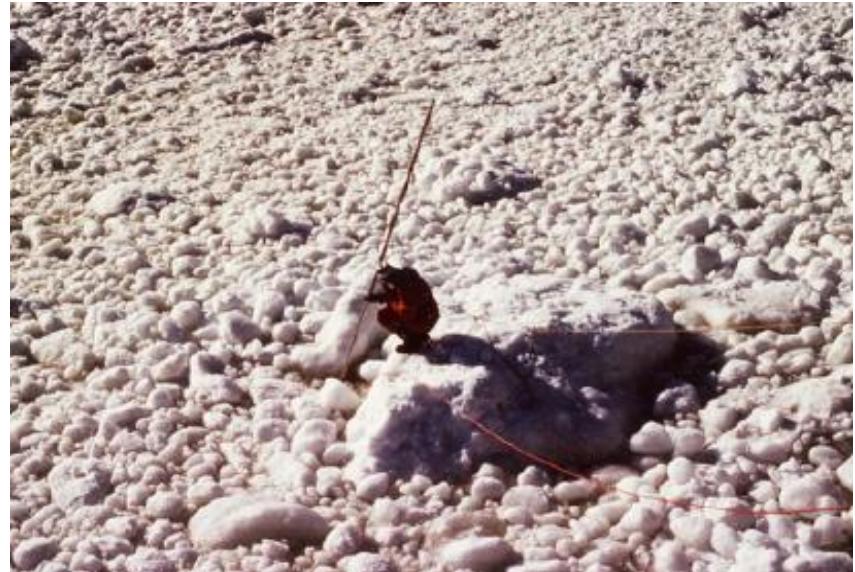

- Discrete Element Method tool to simulate brash ice
 - Numerical modeling of brash ice particles
 - Develop DEM scheme
 - Generating brash ice channel
 - Cylinder experiment – Sensitivity analysis
 - Simulating ship model experiment

Brash Ice

- Accumulated broken ice in a channel

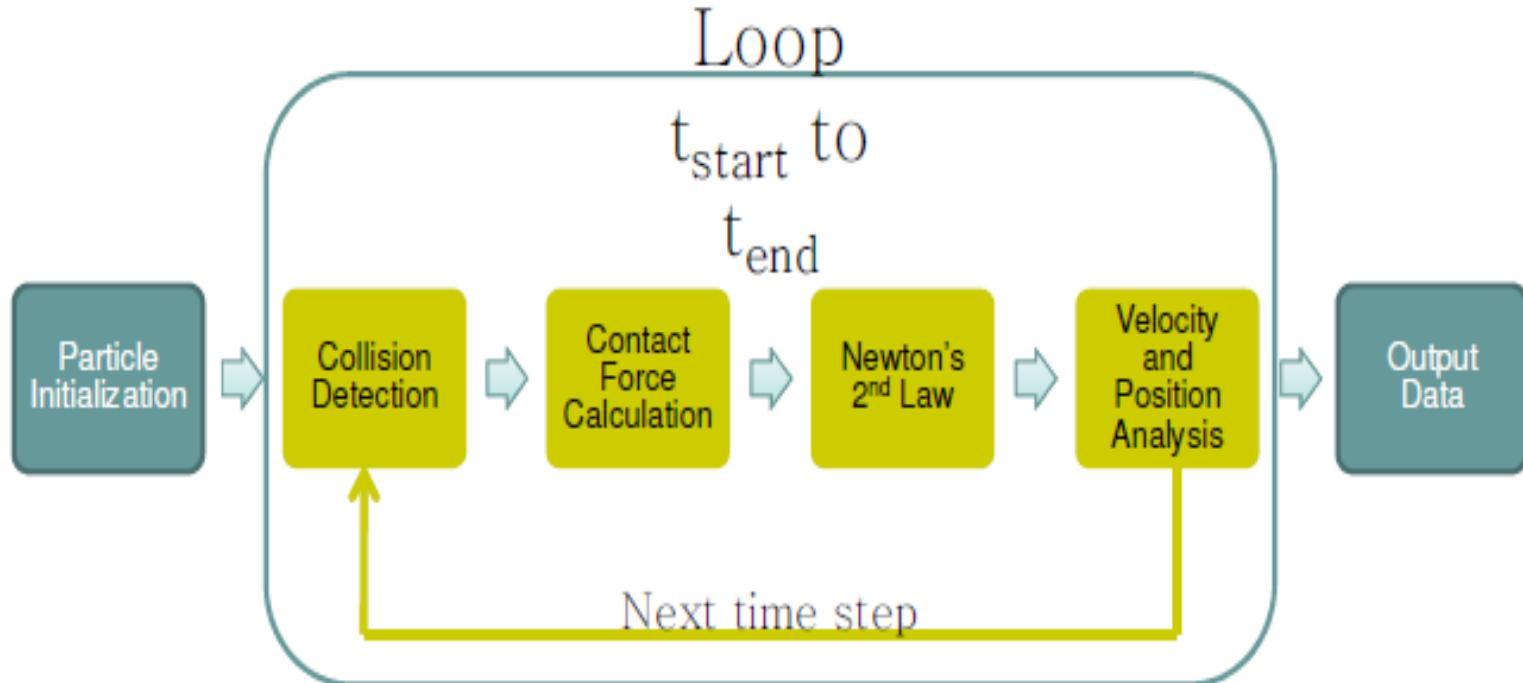

Ship navigating in brash ice channel

Brash ice particles

Discrete Element Method

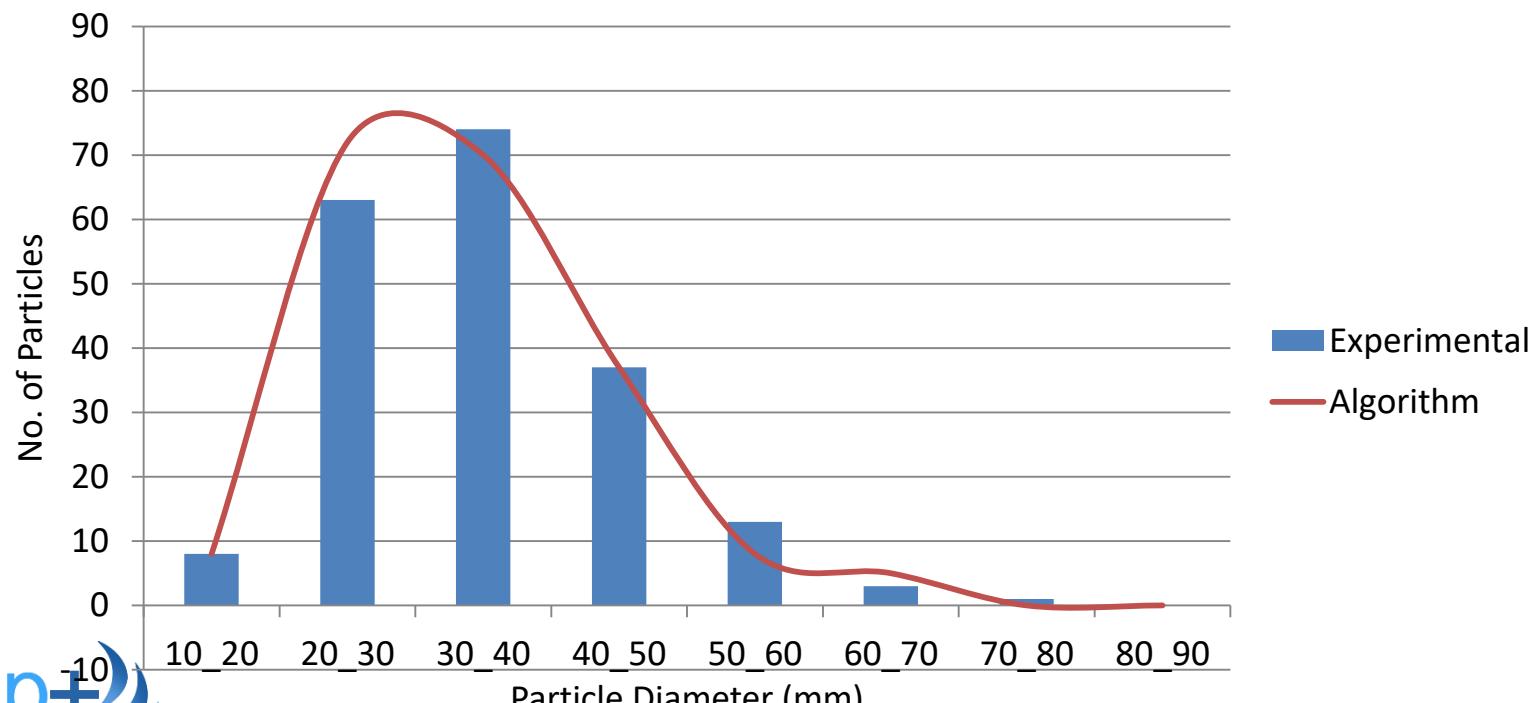

Simple Example of DEM

(source :Simulation-Based Engineering Lab, University of Wisconsin)

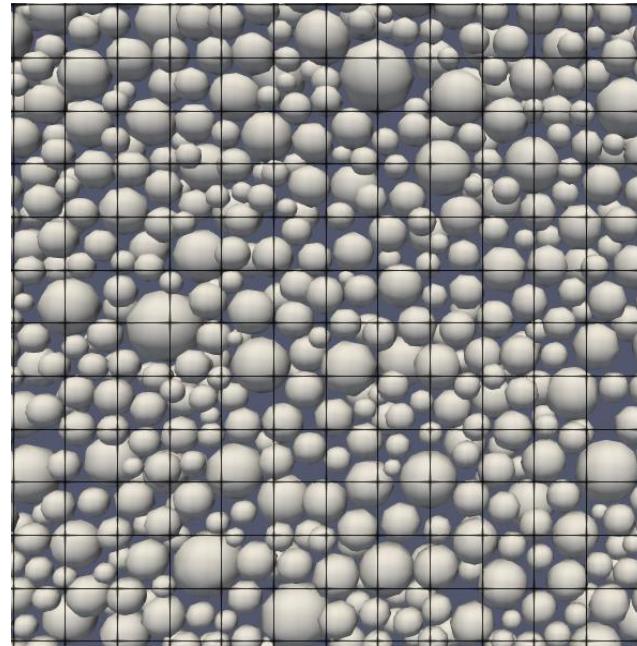

Modelling of Ice Particles

- Spherical granular particles
- Particle size distributed in lognormal - ship scale
- Scaling of ice particle size to model scale

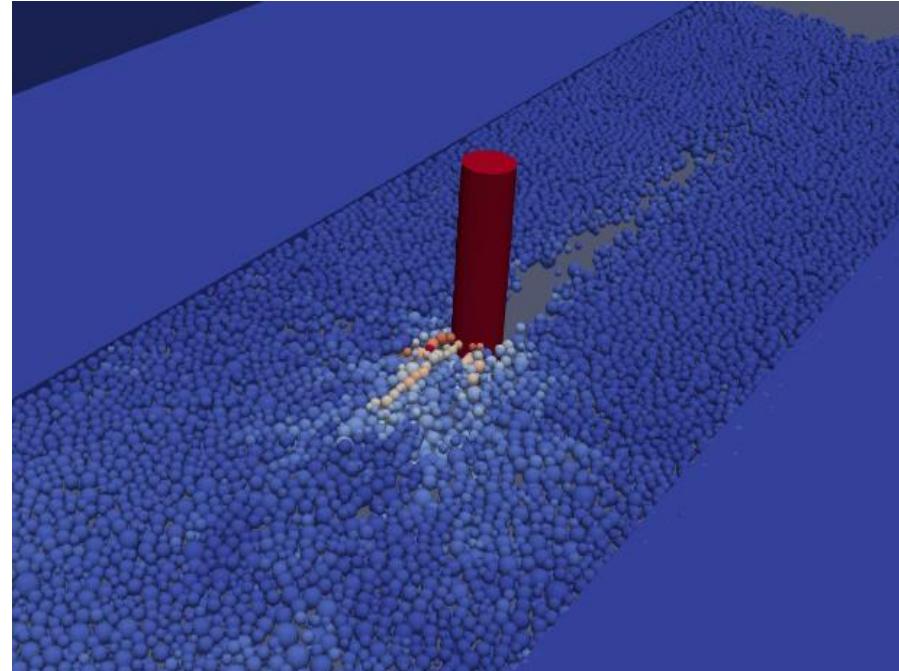

Generating Brash Ice Channel

- Input parameters – length, width, brash ice thickness and porosity
- Floating up technique

Cylinder Experiment

- Calibrate parameters
- Compare channels
- Validate forces

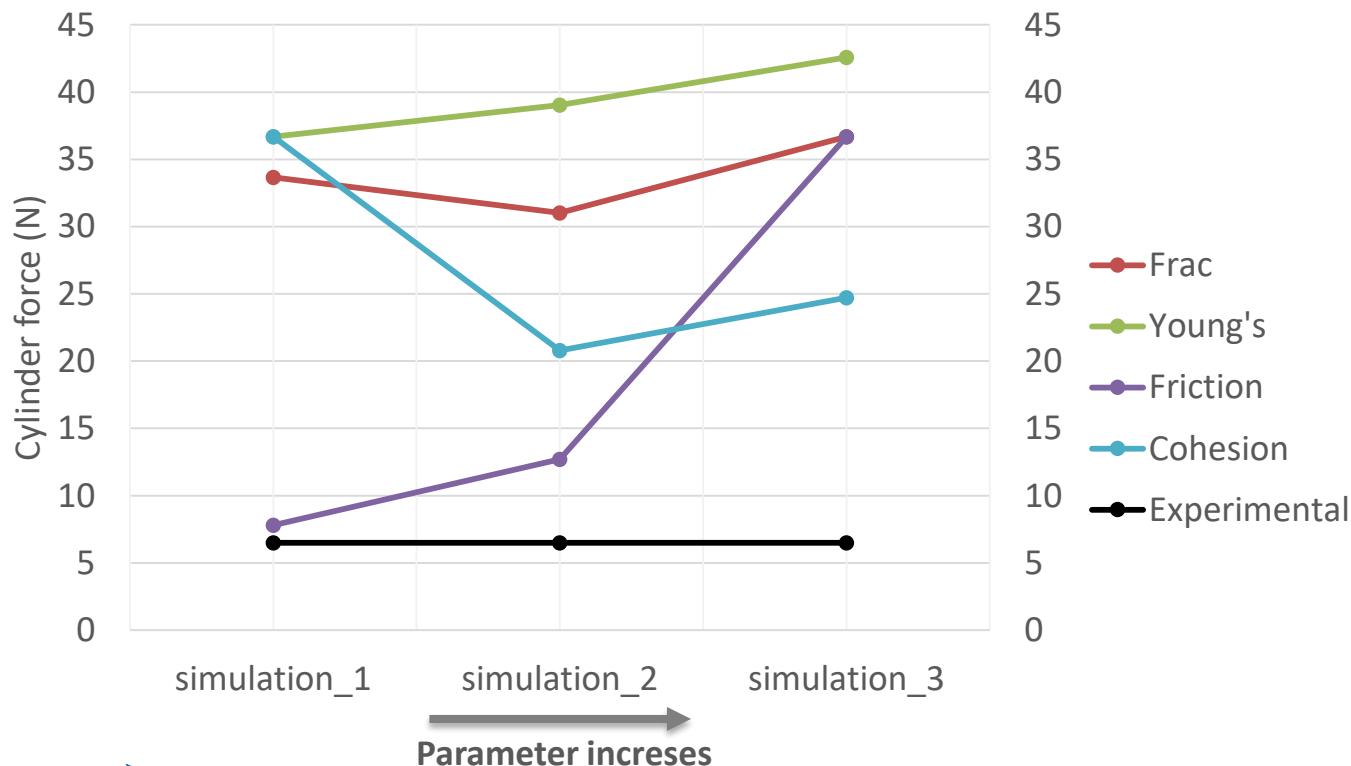

Cylinder experiment simulation

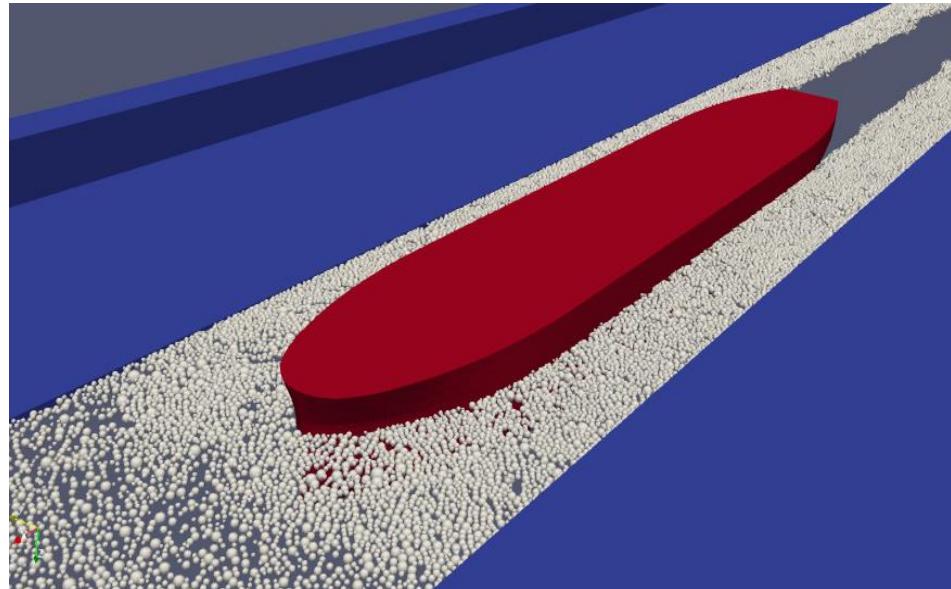

Sensitivity Analysis

- Parameters: Time step(frac), Young's Modules, Friction Coefficient, Cohesion Coefficient

Brash Ice Ship Model Test

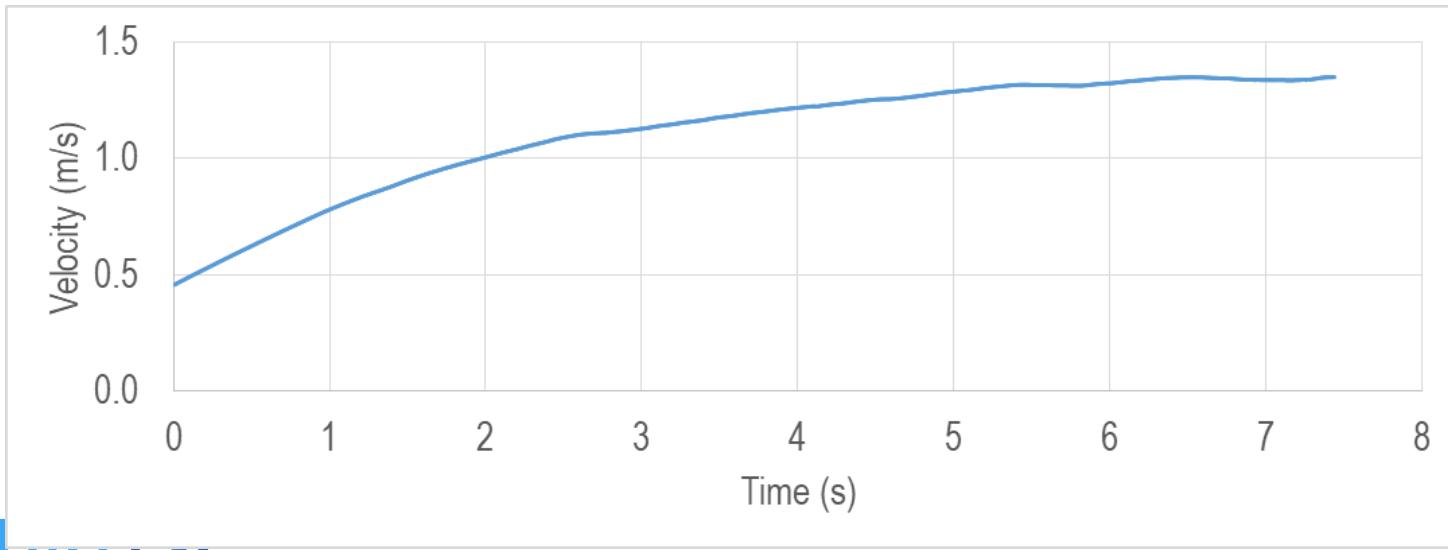

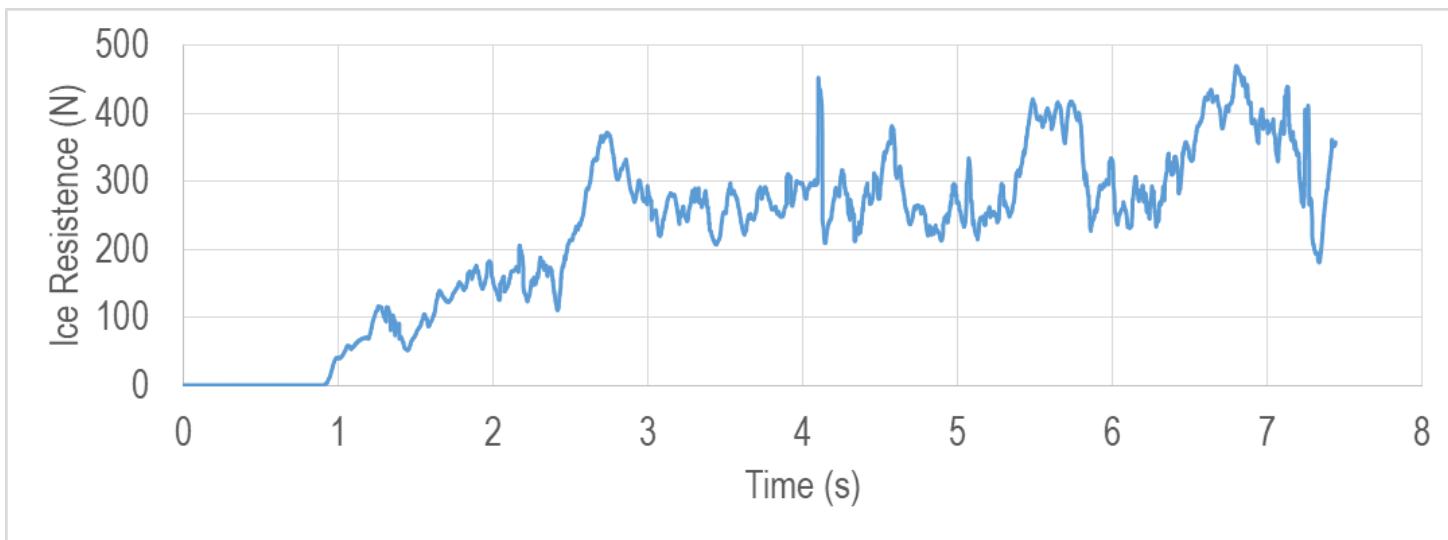

- Self propulsion test
- Input : Ship Model and Propeller Curve
- Output: velocity, acceleration, thrust force and ice forces

Ship model simulation

Numerical Results

Conclusions

- DEM for ship-brash ice interactions
- Visualization tool
- Force model has to improve

Thank You !

DEM Algorithm
